Okay, good evening, so, we startoff with a concept view of a classroom taeching biology, the brain is now far easier to understand with it being right infront of you, the white boxes, are supposed to be popups that come up with relevant information with keypoints on the topic being taught, thats, the brain in this case.

So going to another period, or class...

Geography

Here we have a sort of scale representation of a volcano and our favourite planet, topics such as erosion and plate tectonics, which is comparitively better than having to draw things on board or in your head. So going back to the main room. And to another class.

Music

Here we have the music room where we have instruments, here VR can save costs on paper sheets, show frets for guitars as we play, and piano keys falling from the sky onto your piano for your to play along. Moving back to the main room.

Chemistry

And heres Chemistry, it can easily help people get a close look at the fundamentals of basically the world, even visualise atoms at, well, an atomic level, here too, the white boxes are a place holder for live and relevant information.

And thats prettymuch it, we would have loved to give a sneak peak of the Assistant and the EdStore, but maybe next time.
